

The **SHARE** Approach Overcoming Communication Barriers With Your Patients

Workshop Curriculum: Tool 3

The SHARE Approach is a five-step model, curriculum, and toolkit for shared decision making developed by the Agency for Healthcare Research and Quality. The SHARE Approach aims to help healthcare professionals work with patients to explore and compare healthcare options through meaningful dialogue about what matters most to the patient and to make the best possible healthcare decisions.

Communication barriers get in the way of good healthcare.

This guide offers tips for overcoming communication challenges so you and your patients (and the families and friends who accompany them) can engage in effective shared decision making. This guide also focuses on ways to efficiently work with qualified medical interpreters.

Language, hearing, and visual barriers are common in the United States.

Consider these statistics:

- Approximately 9 out of 100 people have limited English proficiency.
- More than 3 out of 100 people have a hearing disability. That means they are deaf or have severe trouble hearing.
- More than 2 out of 100 people have a visual disability. That means they are blind or have severe trouble seeing, even with glasses.

Did you know it's the law?

- **Civil Rights Act.** All healthcare providers who get Federal funds **must** ensure equal access to services. Offering a qualified medical interpreter, free of charge, and having translated written materials is a good way to overcome language barriers with patients (and companions) with limited English proficiency.
- If a patient chooses to use a family member or friend as an interpreter, it's a good idea to use your own interpreter as well.
- **Americans With Disabilities Act.** All healthcare providers (regardless of funding) **must** provide effective communication, free of charge, to patients (and companions) with disabilities. The method of providing effective communication can vary. It may include using a qualified medical interpreter, providing large-print materials, or writing out instructions.
- **Informed consent.** Based on statute, regulation, and case law, the informed consent process requires explanations of the benefits and risks of treatment alternatives.

Set the stage for good communication.

Shared decision making helps patients take charge of their care. In order to give fully informed consent, patients need information they can understand. Their companions (family members or friends who accompany them) do, too.

Check off the strategies you will try.

- Assess and record your patients' communication needs. Choose decision aids that match the needs of your patients.
- Find or train qualified medical interpreters.
- Tell patients (and companions) — orally and in writing — that you provide interpreters and decision aids that enhance communication.
- Train staff to better serve patients who have communication barriers.

Choose decision aids that enhance communication.

Many decision aids can transcend barriers to communication. Here are just a few.

Language Barriers

- Materials that are culturally appropriate, translated, or written in plain language
- Visuals such as pictures and graphs

Hearing Barriers

- Print materials
- Text telephones (TTYs)
- Videos with captions
- Written instructions

Visual Barriers

- Audio recordings
- Large-print materials and screen magnifiers
- Screen reader software (a software application that is a form of assistive technology, which can re-present information in text-to-speech, sound icons, or a Braille output device)

Qualified medical interpreters can help with language or hearing barriers.

Qualified medical interpreters can be certified freelance interpreters, employees from language agencies, trained bilingual clinicians and staff, or community-based medical interpreters from local colleges, faith-based organizations, social services programs, migrant health clinics, and more.

The use of **unqualified** interpreters—such as a family member, minor child, friend, or unqualified staff member—is not advisable. That choice is more likely to result in misunderstandings and medical errors.

Language Barriers

A qualified medical interpreter who helps people with limited English proficiency is trained in:

- Ethical standards.
- Cultural issues.
- Healthcare words and concepts.
- How to interpret between languages.
- How to translate instructions.
- Relevant languages for your patients.
- Correct positioning in the room.

Hearing Barriers

Several types of qualified medical interpreters help people who are deaf or hard of hearing:

- **Sign language interpreter.** This person uses American Sign Language (ASL) or Signed English.
- **Oral interpreter.** This person articulates silently and clearly and uses gestures.
- **Cued-speech interpreter.** This person does everything an oral interpreter does, but also uses a hand code to stand for each speech sound.

Checklist for Working With Qualified Medical Interpreters Onsite

Before the Visit

- Gather any needed decision aids. Make sure they match the communication needs of your patients (and their companions).
- Tell the interpreter what the visit will be about. Make sure the interpreter understands the information, especially if the patient's life may be at risk.

During the Visit

Make sure:

- Everyone in the room can see each other.
- Your patient knows the interpreter's name and what the interpreter will do.
- Your patient knows that the interpreter is a confidential source who will not share any of the information.
- Your patient is making the healthcare decisions. Some patients defer to their interpreter to make choices for them.
- Your patient understands the main points. Use teach-back to make sure you presented information in a way your patient understands. Have your patients explain to you, in their own words, what you said. Ask the interpreter to tell you exactly what your patient said so you can check for comprehension.

Offsite Qualified Medical Interpreters

When working with offsite interpreters, make sure you and your staff know how to use any needed equipment, such as dual handsets or speakerphones in the exam rooms.

Over-the-Phone Interpreters

Trained telephonic interpreters provide offsite multilingual interpretation to the patient and healthcare provider by telephone. This service is also called a language line.

Videoconferencing

The interpreter can see, hear, and assess the body language of the patient and the healthcare provider via a video remote interpreting service.

Risks of Using Untrained (or Unqualified) Medical Interpreters

Using unqualified medical interpreters should be avoided to protect patients and providers. Still, at times, your patients may want their bilingual family member to interpret for them, and, of course, you want to honor their request.

Letting your patients use an interpreter of their choice does not, however, mean a qualified medical interpreter cannot be present to make sure no mistakes are made. Using untrained staff to interpret has been shown to lead to clinically significant medical errors.

Challenges with using unqualified interpreters include:

- They may be unfamiliar with technical or scientific language.
- They may inadvertently commit interpretive errors.
- They may editorialize your patient's responses.
- When family members interpret, they may impose their view of your patient's health, which may pose a problem with patient privacy.
- When a minor child interprets, the child is in a very vulnerable position and the practice is at risk for liability if something goes wrong. Also, your patient may be less likely to discuss more personal health topics when a minor child interprets.

If you must work with an untrained interpreter, make sure information is being exchanged accurately.

Tips:

- Never use minor children to interpret.
- Remind the interpreter to interpret everything accurately and completely.
- Ask the interpreter to avoid paraphrasing or answering for your patient.
- Interact frequently with your patient and use teach-back.

Funding Qualified Medical Interpreters

Here are some ways to pay for qualified medical interpreters:

- Find out if your State's Medicaid or State Child Health Insurance Plan reimburses for interpreters or contracts with interpreter organizations.
- Develop collaborative contracts with other practices and hospitals in your region for onsite interpreters or an offsite telephonic interpreter service.
- Arrange for your bilingual staff to get trained and become qualified medical interpreters.

Resources for Healthcare Providers

Information about working with qualified medical interpreters and cultural competency is available in A Patient-Centered Guide to Implementing Language Access Services in Healthcare Organizations at <https://minorityhealth.hhs.gov/Assets/pdf/Checked/HC-LSIG.pdf>.
