

Acquiring and Using Data to Drive Change

Institute for Healthcare Quality,
Safety and Efficiency

SCHOOL OF MEDICINE

UNIVERSITY OF COLORADO **ANSCHUTZ MEDICAL CAMPUS**

Disclosures

None

Agenda

- 1 Data for QI, Accountability and Research
- 2 Data Use, Management, and Sources
- 3 Epic as a data source
- BREAK —————
- 4 Analyzing Data

Session	2023-2024 Dates & Times*
Quality Improvement & Change Management	January 11: 1-4 p.m. MT January 24: 1-4 p.m. MT
Applied Patient Safety	January 18: 1-4 p.m. MT
Acquiring Data to Drive Change	February 7: 1-4 p.m. MT
Designing for Change	February 14: 1-4 p.m. MT
Spreading Change Locally and Nationally	<i>February 22: 1-4 p.m. MT</i>
Coaching and Teaching Quality Improvement	March 7: 1-4 p.m. MT

Data and Measurement Differences

Not all are created equal

Photo credit: Office 365 Stock Images

Learning Objectives

1. Describe the differences between data used for
 - a) Quality Improvement
 - b) Accountability
 - c) Research
2. Recall the 4 main types of quality measures
3. Give an example of why a Quality Improvement project might not want to use an Accountability measure

3 uses

Quality

Research

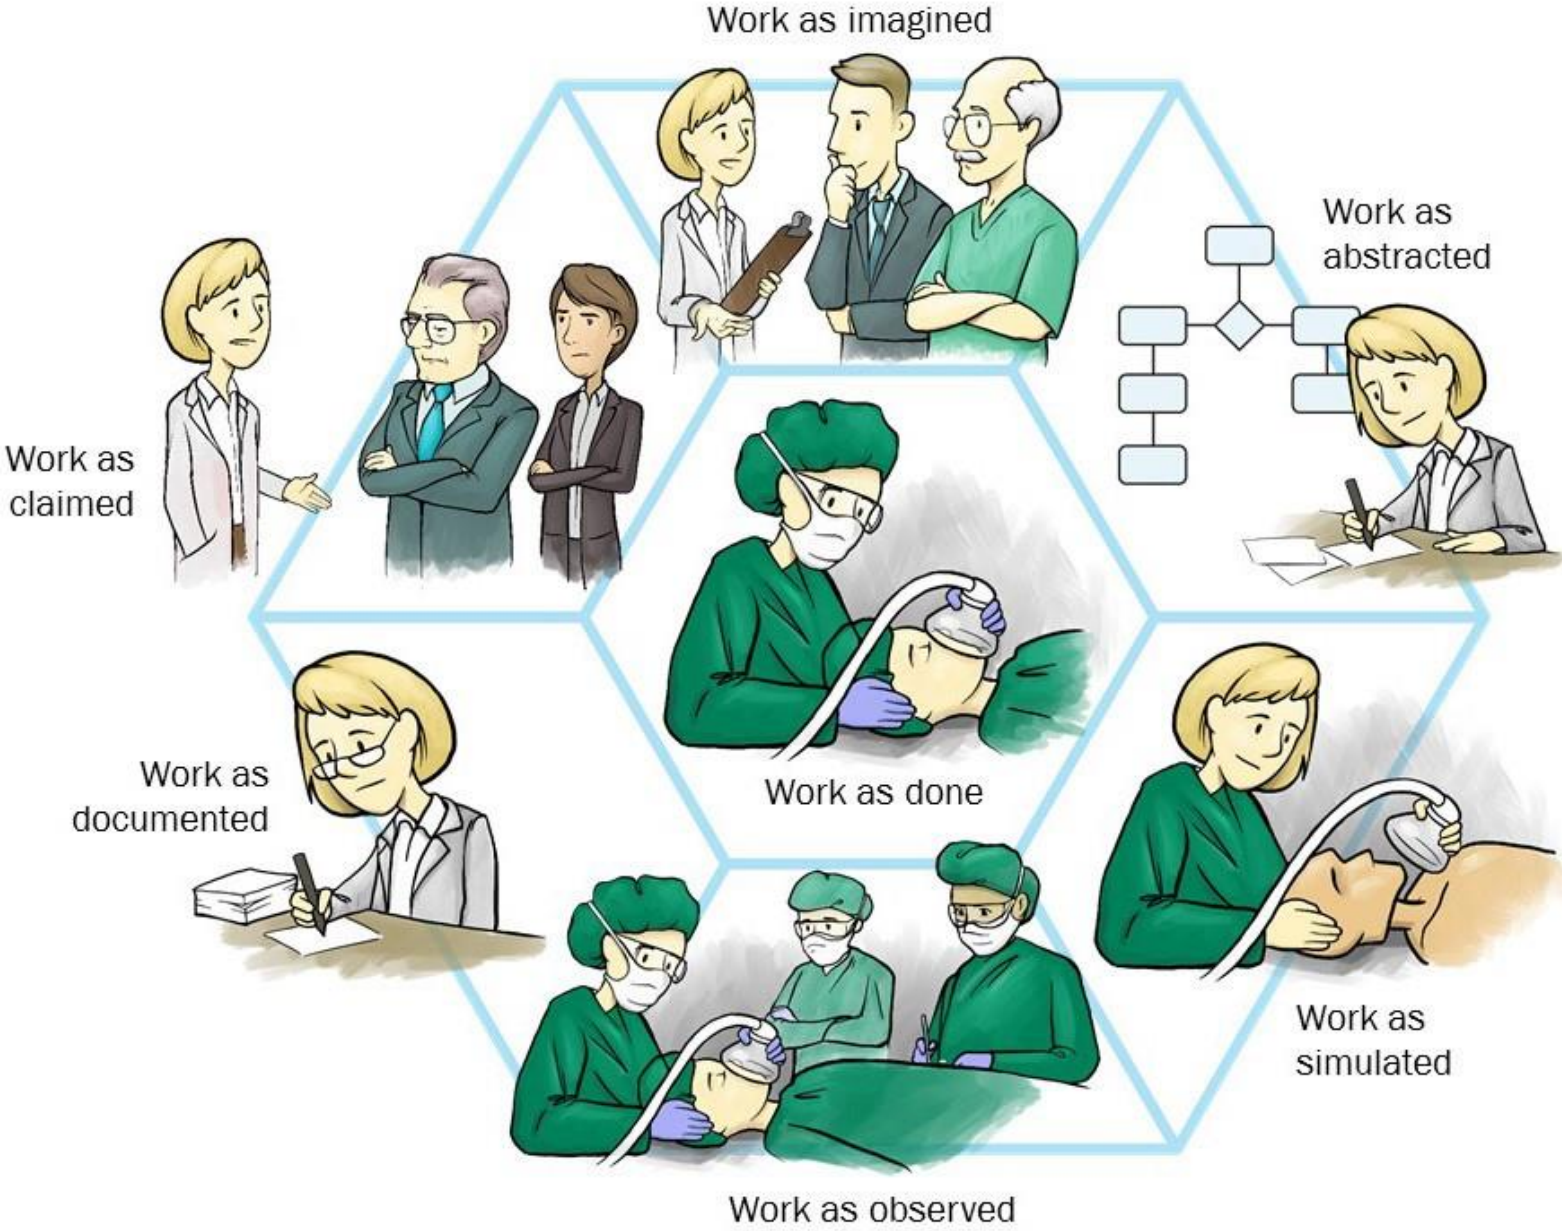

Accountability

Photo credit: Photo by Pixabay:
<https://www.pexels.com/photo/white-baby-mouse-159483/> Other photos: Office 365 stock

What are we measuring?

Types of Measures – Sepsis QI Example

Measure Type	Example
Structure	- % Weekly shifts with adequate staffing, by discipline (nurse, lab, pharm)
Process	- Time elapsed between: <ul style="list-style-type: none">- Stat lab order (with lactate) placed; Arrival of test tube to lab (nurse)- Arrival of test tube to lab; Lactate lab result in EMR (lab)- Lactate lab result in EMR; Antibiotic order placed (provider)- Antibiotic order placed; Antibiotic start time (pharm, nurse)
Outcome	- % patients with septic shock receiving antibiotics within 2 hours of stat lactate order - % of patients with septic shock surviving to hospital discharge
Balancing	- Time between non-stat, additional lab order placed; Arrival of test tube to the lab - % patients with septic shock receiving antibiotics before blood cultures drawn - % patients with septic shock ordered antibiotics before lactate result available

“Wait, aren’t we already collecting data for CMS?”

- A CMS quality measure: “Percentage of patients who received appropriate care for severe sepsis and/or septic shock”
- Requires collection of 34 data points
- Why not use ‘that data?’

**Data for QI and data for Accountability,
can they be the same?**

Accountability Measures

- System level measures of performance
- For leadership and individuals outside of the system
- No test of change, no hypothesis
- Measures have ‘strategic importance’ to maximize public health
- Measures addresses known ‘gap in care’ based on existing evidence
 - Process measures should link to improved health care outcomes
 - Outcome measures should be improvable by health care organizations
- **More likely to be ‘ideal work’ concepts**

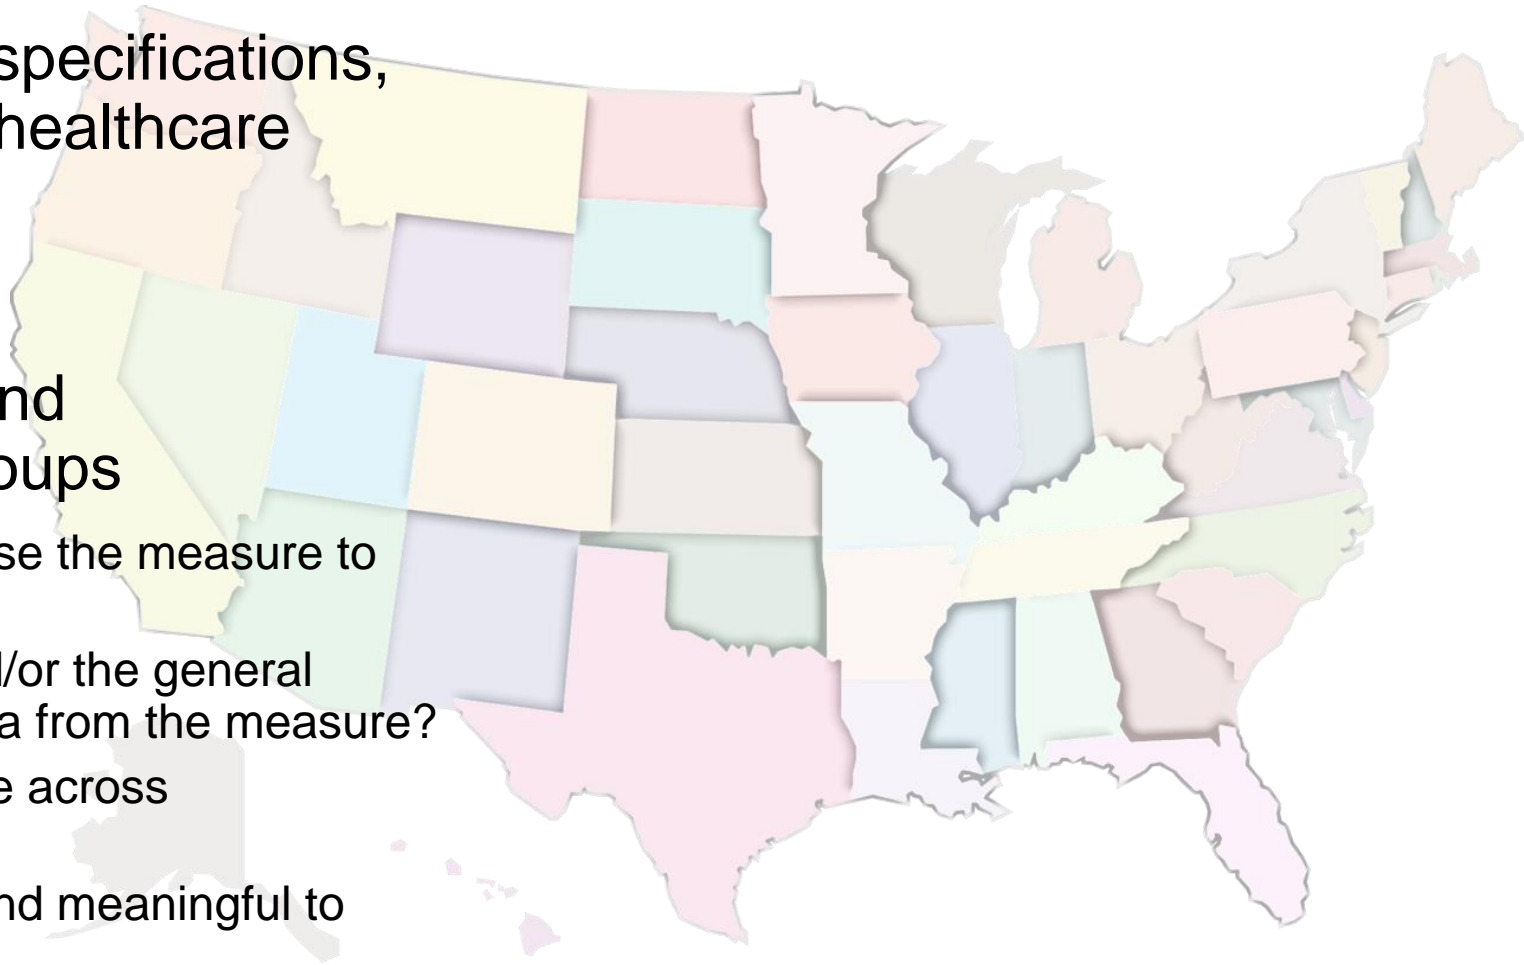

Image credit: Office 365 Stock Images

Accountability Measures

- Measures have well defined specifications, are reliable and valid across healthcare organization types
- Measures are “meaningful” and “interpretable” by different groups
 - Can the healthcare organization use the measure to improve care quality?
 - Can healthcare administration and/or the general public understand and use the data from the measure?
 - Can reliable comparisons be made across organizations?
 - Measures should be acceptable and meaningful to diverse populations.

Accountability Data

- Useful variation in data
 - Actual data cannot be all 0s or 100%
 - To 'drive improvement' there must be something to improve
 - **NOTE:** Exception to this rule is monitoring for safety
- However, 'report card' style reporting often uses 0s or 100% for easy interpretation
- May also be displayed as a ranking or percentiles
 - Someone always has to be at the top and at the bottom
 - Good for comparing to others, less helpful for quality improvement
 - Is \uparrow score from your improvement or others decline?

Image credit: Office 365 Stock Images

Accountability Data

- Large sample size, 'feasible' data collection (often claims, EMR)
 - Collected infrequently, missing data = rejection (↑feasibility)
 - Time lag between data generation, collection, and public reporting
- Aim for 100% data collection (↑accuracy, ↑cost), unless sampling allowed
- Confounders – important to describe, try to adjust for
 - Data used for judgement and comparison across different groups
 - Severity/risk adjustment ↑ cost and complexity of data collection and reporting
 - Consider stratifying rather than 'adjusting away' important disparities (SDOH)
 - Recommended by experts, but complicates reporting, calculation of 'performance bonus'

Image credit: Office 365 Stock Images

Quality Improvement: multiple local data needs

- Understand current, local process, “real work”
 - Process map, flow diagram, cause/effect diagram
- Understand attitudes of participants in the process (patients, providers, clinical staff)
 - (Dis)Satisfaction with current process
 - Ideas for change
 - Barriers/facilitators for change
- Motivate team/clinic to want to change
- Provide a current baseline
- **Rapidly** track effects of changes in the process
- Learn how participants feel about the changes

Image credit: Office 365 Stock Images

Measures for QI projects

- Need to be specific to the local project and process being improved
- Often include 'process' measures to see if desired steps are occurring
- Need to be specific to a site or clinic, as other groups in the same larger system may be slightly different
 - Multiple groups (medical floors, clinics) can work to improve a shared process, but need to be able to stratify by group or area

Photo credit: Office 365 Stock Images

Data for QI projects

- Collect only what is needed to establish baseline, monitor project
- Small, sequential samples
- Minimal time and cost of data collection
- Data often only useful in local context

- Testing strategy – small sequential tests

- Hypothesis is flexible, it changes as learning takes place (each PDSA cycle)

Image credit: Office 365 Stock Images

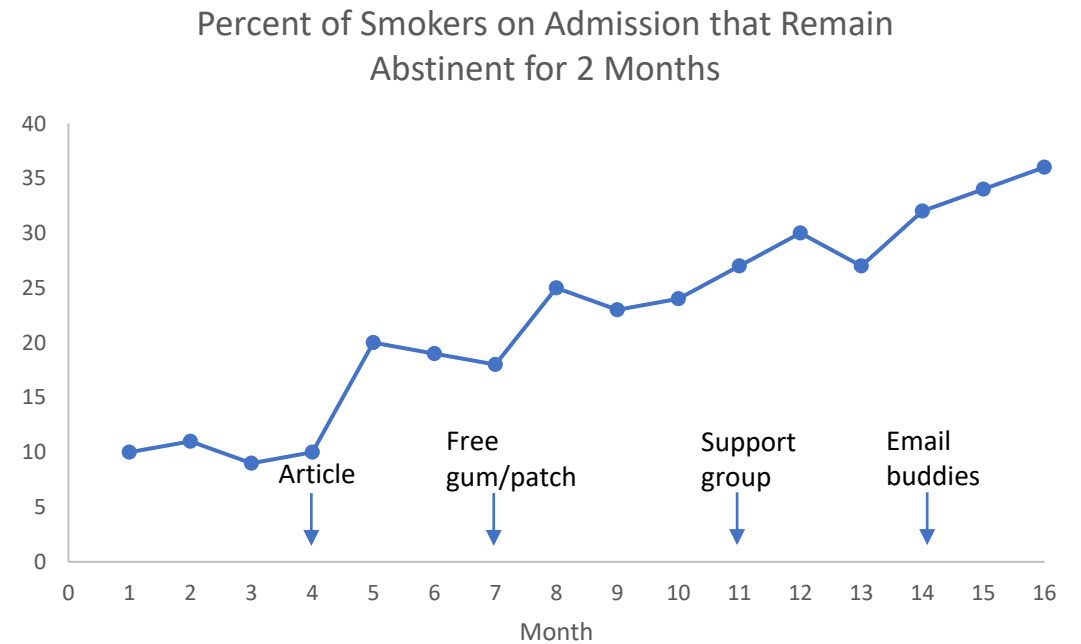

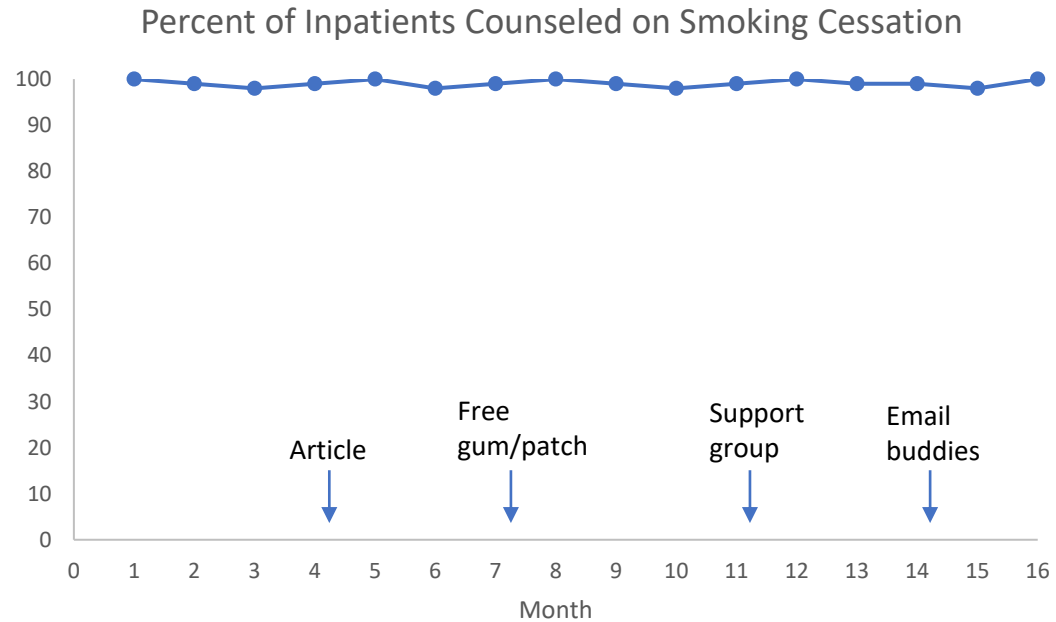

Data for QI projects

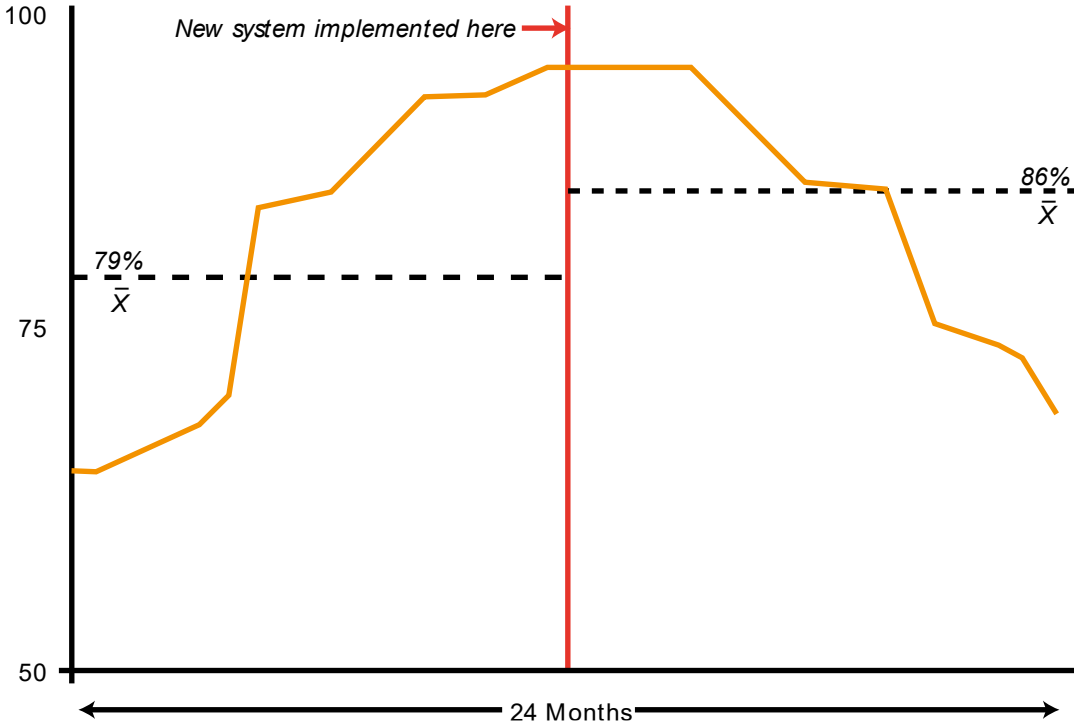

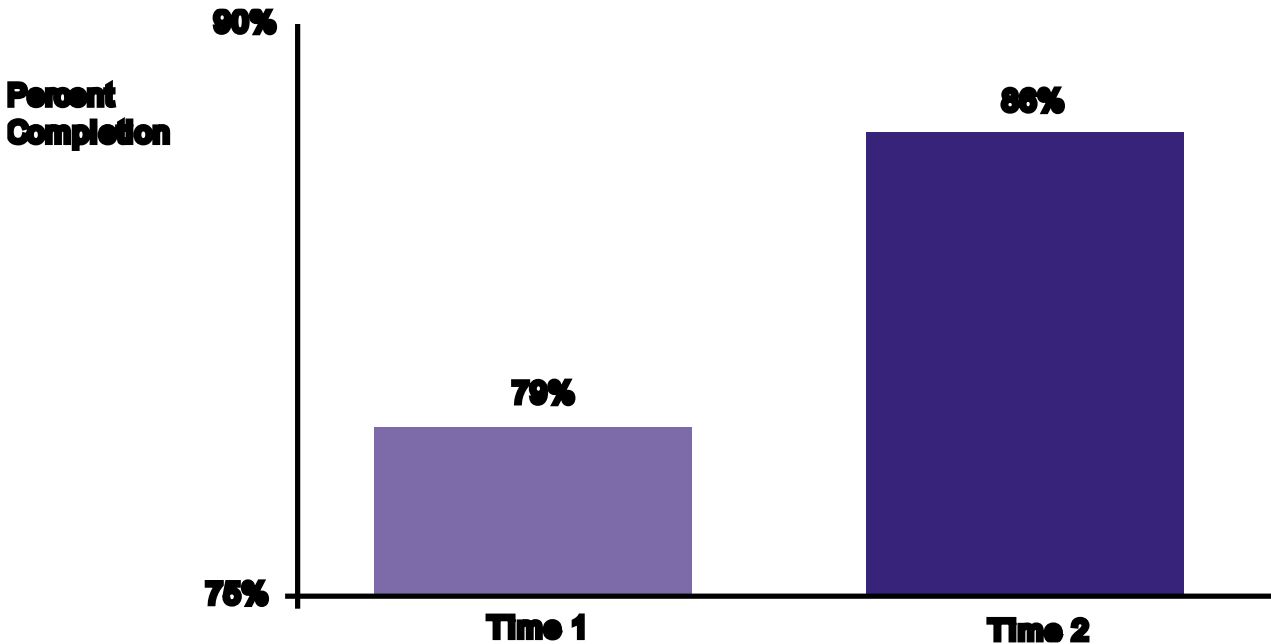

- Confounders may be considered, but rarely measured
- Accept consistent bias within current system
 - Improvements occur despite or ‘in the face of’ bias
 - Subgroup analysis/stratification could demonstrate local process biases
- Measured over time
 - Demonstrate temporal/seasonal influence
 - Detect whether an intervention made a difference

Accountability vs QI – Smoking cessation

Limits of before/after studies in QI

Research – Data needs

- Goal is for universally applicable results
- Need to collect data on as many identifiable confounders as possible
- Control or remove sources of bias
- Focus on characteristics of participants and outcomes
- Less focus on process, unless evaluating feasibility or reliability

Photo by Pixabay: <https://www.pexels.com/photo/white-baby-mouse-159483/>

Research – Data

- Sample size - often large
 - Need to be able to detect a certain, prespecified amount of change in the primary outcome
- Intervention - often blinded to minimize bias
- Hypothesis is fixed, one large test
- **How do we know if there has been an improvement?**
 - Hypothesis testing: t-tests, Chi-square, p-value, confidence intervals, etc.

Photo by Pixabay: <https://www.pexels.com/photo/white-baby-mouse-159483/>

Data Use, Management, and Sources

Tyler Anstett, DO

Institute for Healthcare Quality,
Safety and Efficiency

data noun

da·ta 'dā-tə 'da- *also* 'dä-

factual information (such as measurements or statistics) used as a basis for reasoning, discussion, or calculation

“In God we trust. All others must bring data.”

- W. Edwards Deming

“The goal is to turn data into information, and information into insight.”

- Carly Fiorina, former executive, president, and chair of Hewlett-Packard Co.

Uses for Data in QI

- Problem identification/demonstrate need or buy-in
- Understand WHY
- Reveal solutions
- Track interventions
- Visualize change

Six Steps for a Successful QI Project

1. Define the problem.
2. Identify areas that can be improved.
3. Decide how you will measure progress.
4. Explicitly state your goals (SMART)
5. Implement and measure small tests of change.
6. Build upon success and sustain the process.

Data in every step!

Uses for Data in QI

- **Problem identification/demonstrate need or buy-in**
- Understand WHY
- Reveal solutions
- Track interventions
- Visualize change

Define the problem

Is it a problem?

How do you know?

Who is affected?

By how much?

Are there best practices to refer to?

PROVE IT.

(ahem, with data 😊)

Red Blood Cell (pRBC) Transfusion Recommendations

pRBCs are most likely APPROPRIATE in the following clinical scenarios:

- Hgb < 7 g/dL OR Hgb < 8 with CV disease AND symptoms
- Hemodynamically unstable patient with an acute bleed
- Perioperative acute blood loss anemia with expected Hgb < 7
- Cytotoxic chemotherapy with expected Hgb < 7
- Anemia with symptoms that are intolerable without transfusion

Transfuse 1 unit at a time unless Hgb <6.0 or bleeding out

COST = ~\$700
Per Unit

50% of non-OR, non-MTP, inpatient transfusions **DO NOT** meet guidelines

1783 units transfused outside guidelines x \$700/unit = \$1,248,100.00

Outcome of Add-On Requests from 1/1/2018 to 9/18/2019

Slide Credit: Amber Stokes

Uses for Data in QI

- Problem identification/demonstrate need or buy-in
- **Understand WHY**
- **Reveal solutions**
- Track interventions
- Visualize change

Days from Hospital Discharge to First Scheduled Outpatient Cardiac Rehabilitation Appointment

OUTCOME

Your (ultimate) measure of success.

PROCESS STRUCTURE

The things that lead to your outcomes **AND** are your interventions happening.

BALANCE

What you don't want to change.

OUTCOME

Inpatient DVT rate per 1000 patients

**PROCESS
STRUCTURE**

- % of patients receiving appropriate prophylaxis
- SCDs and pumps in room
 - and applied to patient?

Intervention = EHR guidance based on risk

- Risk score completion in EHR

BALANCE

Bleeding rates.

Pediatric Vaccination Schedules

OUTCOME

Percentage of patients (in a clinic) vaccinated
(NOTE: actual outcome is disease)

PROCESS

% of patients offered vaccine
% of patients declined

STRUCTURE

Intervention = pop-up reminder
• % of alerts ignored / followed

BALANCE

Provider alert fatigue
Lower well-child exams for lower SES with a mistrust of vaccines.

OUTCOME

Absolute number of post-op wound infections

% compliance with pre-anesthesia antibiotics

PROCESS STRUCTURE

Intervention: chlorhexidine only in all ORs

- Stock of chlorhexidine

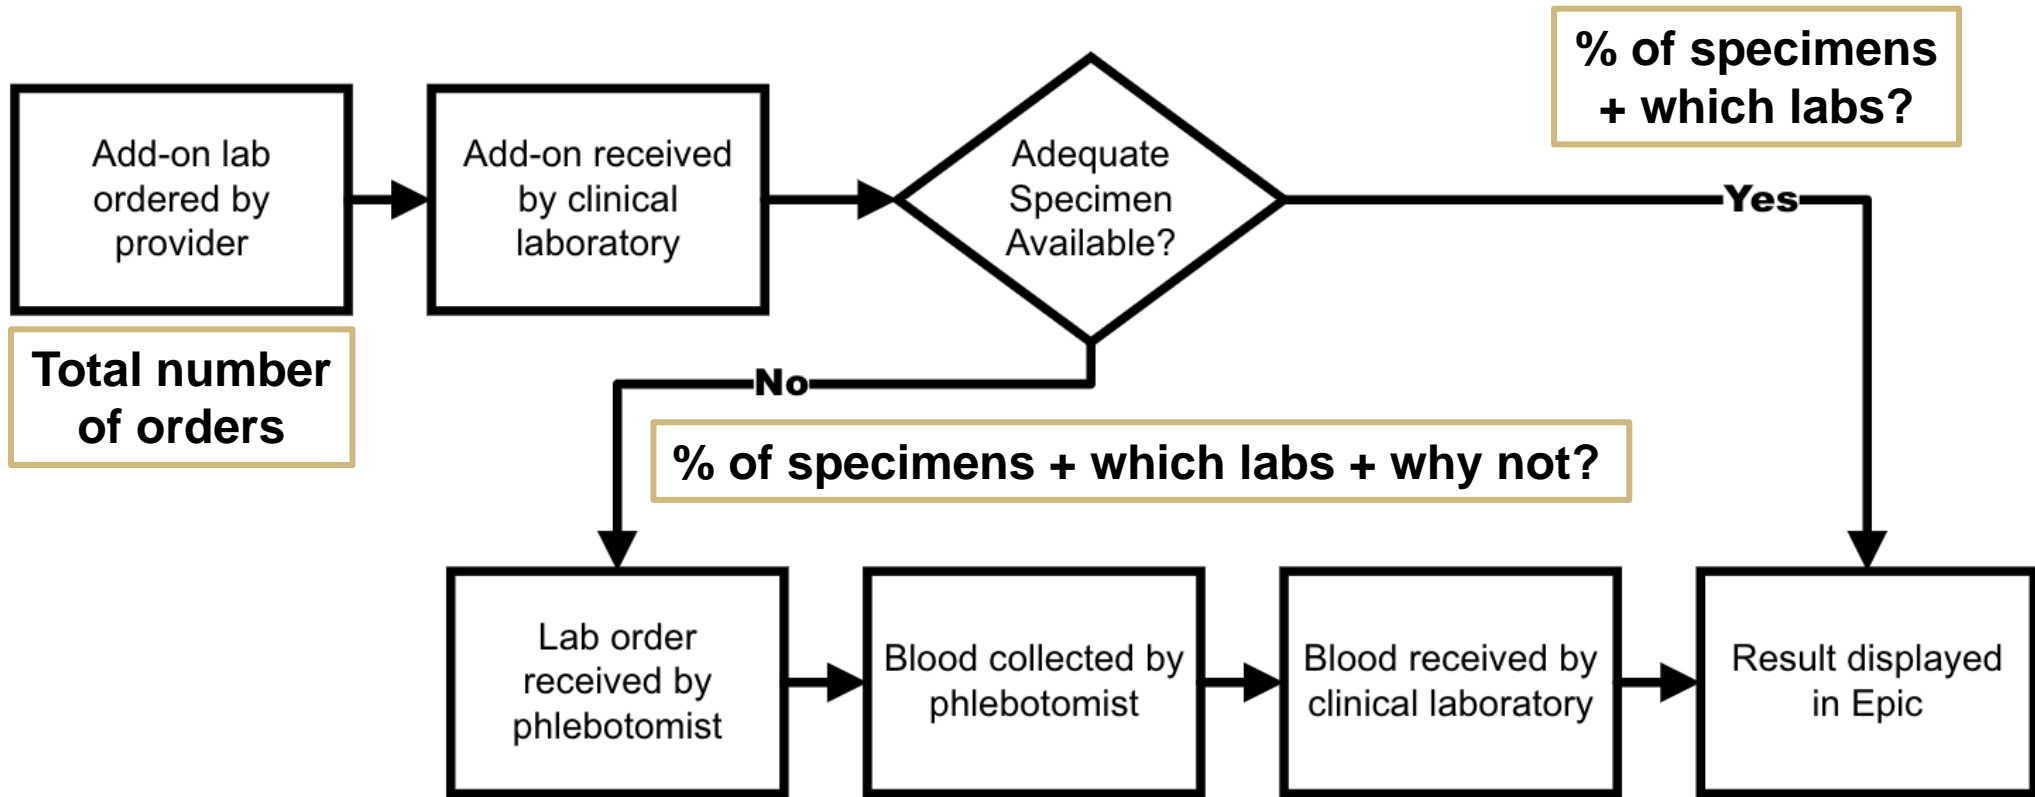

Intervention: chlorhexidine scrub education

- % of techs who attended sessions
- Demonstration of proper scrub technique

BALANCE

Allergic reactions to antibiotics or skin prep

1. ORGANIZE by columns
2. DON'T use color coding
3. Set up BEFORE you start collecting data

“Doveryai, no proveryai.” (Trust, but verify)

Ronald Reagan, United States President 1981 – 1989

**“A minimum put to good use is
enough for anything.”**

Jules Verne, *Around the World in Eighty Days*

Getting Data from Epic

Learning Objectives

1. Identify which data types are most helpful to use in your project
2. Determine which data reporting tools you should use
3. Discuss how you'll get your “critical piece of data?”

Outline

1. Structured versus unstructured data in the EMR
2. Epic Specific Structural Overview
3. Data Collection from Epic

Types of Data in the EMR

Structured Data Elements

- Data that can be stored in pre-defined fields
- Examples: Orders, Medications, Labs, Flowsheets, SmartLists, Smart Forms, Coded data (CPT, ICD-10, Snomed, smartdata elements...)
- Easier to obtain in automated way

Unstructured Data Elements

- Data that cannot be put into row-column organization
- Examples: Free text (i.e. notes), curated data (i.e. imaging, pathology, procedural reports), scanned documents, images
- Generally, not linked to data elements = Hard to search for
- Rarely can automate = manual chart review to obtain

Report Viewer

The proximal ascending aorta is mildly dilated.
The aortic root is mildly dilated.
There is no evidence of a pericardial effusion.

Compared to prior study, there is no significant change.

Procedure Two patient identifiers were confirmed prior to performing this exam. A complete transthoracic echocardiogram was performed (2D, M-mode, Spectral and Color Flow Doppler imaging). The image quality of this exam is: adequate. Image enhancing agent (Definity) was administered to improve endocardial definition.

Left Ventricle The left ventricle is normal in size. There is mild concentric left ventricular hypertrophy. Left ventricular function is moderately reduced. Calculated biplane EF is 38.5 %. The inferior wall is hypokinetic. The apex is hypokinetic. There is echocardiographic evidence of diastolic dysfunction. Left atrial pressure is elevated.

Right Ventricle The right ventricle is borderline dilated. Normal right ventricular systolic function.

Atria The left atrium is mildly enlarged. The right atrium is enlarged.

Mitral Valve The mitral valve leaflets appear thickened. There is mild mitral annular calcification. There is trace mitral regurgitation. There is no evidence of mitral valve stenosis.

Tricuspid Valve The tricuspid valve leaflets are thin and pliable and the valve motion is normal. There is trace tricuspid regurgitation. Right ventricular systolic pressure is 32.7 mmHg plus right atrial pressure (central venous pressure). Right ventricular systolic pressure is elevated.

- Tool: Reporting Workbench
- Benefits: Real-time
- Negatives: SLOW

- Tool: Crystal reports
- Benefits: close to real time, full data set
- Negative: Requires SQL coding and other tools

- Tool: SlicerDicer, Dashboards
- Benefit: fast, self-service
- Negative: Loses context/detail

Choosing the Right Tool

- Questions to ask?
 - Does the data need to be in real time?
 - Does the report need to be automated?
 - Does it need to be interactive/visual?
 - Will this require large amounts of data to sift through or display?
 - What will the data be used for? Monitoring trends? Care Team Communication

SlicerDicer

Pros

- Accessible to all providers
- Great visual tool and for following trends
- Great for large or old data
- Can be aggregated and exported using additional Epic tools (ie Dashboards)
- Run analytics and test basic hypotheses without needing IRB approval (no patient identifiers)

Cons

- Not real-time data (1 day behind)
- Newer tool, currently w/ limited data models and “slices”, but is growing with more and more models being added
- Data storage varies institution to institution and sometimes difficult to find the information you want

Reporting Workbench

Pros

- Accessible to all providers
- Provides real-time, actionable data
- Easy connection to patient information
- More complete data models available
- More customizable options
- Can be exported and used in additional Epic tools (ie Dashboards)

Cons

- Very slow to pull larger/older data
- Higher learning curve
- Often need data analyst support to build custom reports
- PHI has data export/storage rules that vary by institution and sometimes providers are limited on what they can export

Data Collection Tools

Institutional specific

- Does your institution have a data request process?
- Do you have departmental leads that can give you support?
- Do you have data analysts or physician builders that can help you?

Break-Out

10 mins

Thinking again about that critical piece of data you need:

- 1. How can you make it a structured data element?**
- 2. How will you plan to get this data?**

A top-down photograph of two white coffee cups on a light-colored wooden tray. The cup on the left is filled with a latte, and the cup on the right is empty. A hand is visible on the left holding the handle of the latte cup, and another hand is on the right holding the handle of the empty cup. A semi-transparent white rectangular box is overlaid in the center of the image, containing the text 'BREAK-TIME' and 'Come back at 3:08 pm MT'.

BREAK-TIME

Come back at 3:08 pm MT

Top 15 Add-On Failures: UCH Inpatient January – August 2017

Haptoglobin is the most failed add-on labs

Investigate haptoglobin (ask WHY?)

Seclusions on T05A by patient's age (Jan - Apr 2018)

NOTE: Adjacent bars of the same pattern are statistically equal ($\alpha = 0.01$). Any differences in height should be considered random.

53% of seclusions happen in 8- and 10-year-olds

Targeted intervention

Measuring that a change has occurred

(IE: data over time)

Uses of Detecting Non-Random Change

- Visualize the performance of your process for easier communication
- Determine whether changes you made to your process resulted in an improvement
- Determine whether improvements introduced to your process are sustained
- Determine what course of action to take

Run Chart

Easy to construct

Easy to interpret
(no advanced stats required)

Understand the inherent
variation within data (10-
15 data points)

Assess the impact of
process changes
(AKA something
happened)

Run Chart - Anatomy

Detect “non-random” change

Shifts

Trends

Runs (too many or too few)

Astronomical Data Points

Run Chart – Interpretation (Non-Random Change)

Shift

Intervention

Six or more consecutive points all above or all below the median.

($p = 0.03$ for 6 points)

Run Chart – Interpretation (Non-Random Change)

Trend

Intervention

Five or more consecutive points all increasing or decreasing.

$$p = 0.031$$

NOTE:

- can include points ON the median
- count equal points as ONE

Run Chart – Interpretation (Non-Random Change)

Astronomical Data Point

Intervention

Data points that are obviously outside of normal variation.

Seek consensus from the team to determine whether a point is “astronomical” or just the high or low point in the data set.

Run Chart – Interpretation (Non-Random Change)

Number of Runs

A run is a series of points on one side of the median. The trendline must cross the median before a new run begins. You can quickly calculate the number of runs by counting the number of times the trendline crosses the median and adding one.

The number of runs in a series should be between a lower and upper limit determined by the number of data points in the data set. Anymore, or any fewer, and the series is likely to be non-random.

Run Chart – Interpretation (Non-Random Change)

Number of Runs

Number of Useful Observations	Lower Number of Expected Runs	Upper Number of Expected Runs
10	3	9
11	3	10
12	3	11
13	4	11
14	4	12
15	5	12
16	5	13
17	5	13
18	6	14
19	6	15
20	6	16
21	7	16
22	7	17
23	7	17
24	8	18
25	8	18
26	9	19
27	10	19
28	10	20
29	10	20

Statistical Process Control (SPC) Chart

Make informed decisions about which processes to leave alone and which to subject to an improvement cycle.

Predict future performance if the system is stable and in control.

Easy to construct

Statistical Process Control (SPC) Chart - Anatomy

Detect “special vs. common cause variation”

Statistical Process Control (SPC) Chart

Statistical Process Control (SPC) Chart

But...there are many types

Data Type	Defect Definition	Subgroup Size	Chart Type
Attribute Data Counted as Discrete Events	Defect Data -Number of defects, not number of defective units	Constant Subgroup Size	c Chart Number of Defects
		Variable Subgroup Size	u Chart Defects per Unit
	Defective Unit Data	Constant Subgroup Size, Usually ≥ 50	np Chart Number of Defective Units
		Variable Subgroup Size, Usually ≥ 50	p Chart Fraction of Defective Units
Variable Data Measured on a Continuous Scale		Subgroup Size = 1	X and R_m Moving Range
		Subgroup Size < 10	\bar{X} and R
		Subgroup Size ≥ 10	\bar{X} and s

Rule 1: A single point falling outside of the control limits.

Rule 2: A shift of 8 or more consecutive points above or below the center line

Rule 3: A trend of 6 or more points in one direction, up or down (two consecutive points of equal value count as one).

Rule 4: Two out of any three consecutive points falling in the outer one third of the control limit.

SPC Chart – Interpretation (Special Cause Variation)

A **single point** falling outside of the control limits.

SPC Chart – Interpretation (Special Cause Variation)

A **shift** of 8 or more consecutive points above or below the center line.

SPC Chart – Interpretation (Special Cause Variation)

A **trend** of 6 or more points in one direction, up or down (two consecutive points of equal value count as one).

SPC Chart – Interpretation (Special Cause Variation)

Two out of any three consecutive points falling in the outer one third of the control limit.

Making Decisions

**ONLY Common Cause (random/normal)
Variation Present**

=

System is “in-control”

**Special Cause (non-random)
Variation Present**

=

System is “out of control”

Making Decisions

Assuming you are not at goal...

**ONLY Common Cause (random/normal)
Variation Present**

System is “in-control”

Overhaul the system

**Special Cause (non-random)
Variation Present**

System is “out of control”

Act on a *specific part* of the system while leaving the system fundamentally intact.

Making Decisions

Making Decisions

Making Decisions

**Out-of-control
not at goal**

Intervention = act on
specific thing(s)

**In-control
at goal**

How much do you trust the results?

What will the weather be like today?

Guessing

- Anecdotal data
- Single data points without trends
- Equivalent of expert opinion

Some Data

- Very basic statistics such as averages
- No variation shown
- Unqualified metrics; metrics out of context
- Perhaps some trends
- Data grouped too broadly
- Helps understand the past but not the future

Good, Detailed Data

- Data that can be sub-grouped
- Advanced statistics
- Data that shows variation
- Puts the past in context
- Supports decision making by predicting the future state

Expert Help

Helpful literature for going “in-depth”

- The Health Care Data Guide: Learning from Data for Improvement. Book by Lloyd P. Provost and Sandra Murray. 2011.
- Fundamentals of Health Care Improvement: A Guide to Improving Your Patients' Care (Third Edition). Book by Ogrinc et al. 2018.

In Summary

- Know your data!
- Find the data you need (NOT what you want)
- Know when change has occurred (and whether you can take credit)
- Use data to make informed decisions
