Background

Most studies of dietary patterns and health focus on diets that are protective against development of disease incidence or progression. The Healthy Eating Index (HEI) is a recommended dietary pattern promoted by the USDA to improve health outcomes on a public health scale. It is a measure of dietary alignment with the Dietary Guidelines for Americans. In addition to global dietary pattern studies, there are focused nutritional intervention randomized control trials that measure the molecular impact of specific foods and nutrients on detailed evaluation of cardiovascular health. The goal of this study was to combine the detailed cardiovascular assessment with an evaluation of participant's baseline dietary patterns.

Methods

- Auto Self-Administered 24 Hour (ASA24) dietary recall data was collected
- Measures of cardiovascular health taken at baseline: BMI, aortic and brachial blood pressures, lipid panel, HbA1c%
- Measures of vascular stiffness: augmentation index, pulse wave velocity
- R program dietaryindex to calculate HEI scores from ASA24 data
- Assessed measures of cardiovascular health by HEI score tertile

Results

Table 1. Demographics and HEI score by tertile

	Overall (N=138)	T1 (N=45)	T2 (N=46)	T3 (N=47)	p-value
Sex					>0.9
Female	92 (67%)	29 (64%)	31 (67%)	32 (68%)	
Male	46 (33%)	16 (36%)	15 (33%)	15 (32%)	
Age	57 (49, 62)	59 (48, 62)	54 (43, 60)	59 (54, 64)	0.035
BMI	24.5 (23.2, 28.0)	27.1 (23.7, 31.2)	25.5 (23.2, 28.2)	23.8 (22.5, 25.7)	0.005
Family Hx of CVD					
Unknown	75 (54%)	26 (58%)	20 (43%)	29 (62%)	
No	42 (30%)	9 (20%)	18 (39%)	15 (32%)	
Yes	21 (15%)	10 (22%)	8 (17%)	3 (6.4%)	
HEI Score	63 (12)	49 (7)	63 (3)	76 (5)	<0.001

ASCVD Risk Factors by HEI 2020 Tertile

Figure 1. ASCVD risk factors by HEI score tertile

Measures of Vascular Resistance by HEI Score Tertile

Figure 2. Measures of vascular resistance by HEI score tertile

Conclusion

Mildly lower BMIs were seen in groups with higher HEI scores, representing greater adherence to the Dietary Guidelines for Americans. There were no other CVD risk factors or measures of vascular resistance that corresponded with greater HEI scores based on the 138 participants included here. Additional recruitment is needed to evaluate if there are measurable differences and consider confounding variables.
