Immune Airway-Epithelial Interactions in Steroid-Refractory Severe Asthma-Core B

The overall hypothesis for this P01 application is that the pathophysiology of steroid refractory severe asthma involved cooperatively between heightened IL-27 and Th1 (IFN- γ) immune responses often accompanied by Th17 and residual Th2 responses plus a deficient IL-10 response. This atypical immune response, not appreciated heretofore, induces specific downstream effects on airway epithelial cells, which perpetuate the inflammatory response resulting in chronic disease.
