WATCH-PD

Wearable Assessments in the Clinic and Home in PD

Have you had a diagnosis of Parkinson Disease (PD) for 2 years or less?

AND

Have not started any drug therapy for your PD?

If you answered YES to both questions, you may be a potential candidate for WATCH-PD, a study conducted by the Parkinson Study Group (PSG) to learn more about early Parkinson disease (PD) through sensor measures in clinic and at home. *These measures will be compared to traditional in clinic PD assessments.* The application ('app') and features of this iPhone along with the Apple Watch will allow us to gather information from activities you complete at home.

You may qualify for the study if you also:

- *Are at least 30 years old at the time of diagnosis*
- *Are able to provide written informed consent*
- *Are able and willing to comply with study-specific procedures*
- *Are not pregnant or intend to become pregnant*

What is involved if I participate?

- *In-home and clinic assessments involving study-supplied sensors, Apple Watch and iPhone*
- *Your participation will last approximately 14 months, consisting of in-clinic visits, telephone calls, and at-home app assessments and use of the Apple Watch*
- *Two brain imaging scans will be required*

If you are interested in participating or want to learn more, contact
