

StARR Research Meeting  
Thursday, December 11, 2025  
Research Complex 2, 3109

---

**Attendees:**

**PI's:**

*David Schwartz, MD, Distinguished Professor of Medicine and Immunology; Associate Dean for Translational Sciences; Director, Program to Advance Physician Scientists and Translational Research*

*Peter Buttrick, MD, S. Gilbert Blount Endowed Professor*

*Steve Abman, MD, Director, Pediatric Heart-Lung Center; Founder and Co-Director, Pediatric Pulmonary Hypertension Program; Professor of Pediatrics*

**Residency Directors:**

*Mark Nehler, MD, Professor, Vice Chair of Education for Surgery; Director, General Surgery Residency Program*

*Julia Limes, MD, Associate Professor, Medicine-Hospital Medicine; Director, Internal Medicine Residency Program*

*Jason Espinoza, MD, Assistant Professor, Pediatrics-Critical Care Medicine; Director, Pediatrics Residency Program*

**Mentors:**

*Maria Amaya, MD, PhD, Assistant Professor, Medicine-Hematology (mentee-Kellen Gil, MD)*

*Sarkis (Chris) Derderian, MD, Assistant Professor, Surgery-Pediatric Surgery (mentee-Caitlin Eason, MD)*

*Sarah Taylor, MD, Associate Professor, Pediatrics-Gastroenterology, Hepatology, and Nutrition (mentees-Ioannis Ziogas, MD, and Lauren Maloney, MD)*

*T. Brett Reece, MD, Professor, Surgery-Cardiothoracic Surgery; Director, Thoracic Aortic Program (mentee-Brian Wu, MD)*

*Ken Tyler, MD, Professor, Louise Baum Endowed Chair of Neurology*

**Scholars:**

*Kellen Gil, MD, Department of Medicine*

*Caitlin Eason, MD, Department of Surgery*

*Lauren Maloney, MD, Department of Pediatrics*

*Ioannis Ziogas, MD, Department of Surgery*

*Sadie Meller, MD, Department of Pediatrics*

*Brian Wu, MD, Department of Surgery*

### **Scholar Presentations:**

- 4:20-4:40 pm:** Kellen Gil, MD, Department of Medicine: *The STAT3-VDAC1 Axis Modulates Mitochondrial Function and Plays a Critical Role in the Survival of Acute Myeloid Leukemia Cells*
- 4:40-5 pm:** Caitlin Eason, MD, Department of Surgery: *An In Vitro Model of Fetal Growth Restriction Inhibits Angiogenesis via Extracellular Vesicle Release of microRNA 141-3p.*
- 5-5:20 pm:** Lauren Maloney, MD, Department of Pediatrics: *Concurrent changes in macrophage and T cell subsets over time in murine obstructive cholestasis suggest interplay between macrophage and T cell function in promotion of hepatic injury*
- 5:40-6 pm:** Ioannis Ziogas, MD: *Cellular Senescence in Obstructive Cholangiopathies*
- 5:20-5:40 pm:** Sadie Meller, MD, Department of Pediatrics: *Microglial phagocytic response to EV-D68 infection in the spinal cord during early postnatal development*
- 6-6:20 pm:** Brian Wu, MD, Department of Surgery: *Exploring Mitochondrial Transplantation as a Novel Therapy for Embolic Stroke*

# The STAT3-VDAC1 Axis Modulates Mitochondrial Function and Plays a Critical Role in the Survival of Leukemic Stem Cells

Kellen Gil  
(PI: Maria Amaya)

# Acute Myeloid Leukemia

- AML is an aggressive leukemia
- The average age of diagnosis is 69
- Estimated 20,380 new cases of AML in 2023
- About 11,310 deaths from AML yearly

# Incidence and Prognosis of Acute Myeloid Leukemia

Source: SEER 18 areas (San Francisco, Connecticut, Detroit, Hawaii, Iowa, New Mexico, Seattle, Utah, Atlanta, San Jose-Monterey, Los Angeles, Alaska Native Registry, Rural Georgia, California excluding SF/SJM/LA, Kentucky, Louisiana, New Jersey and Georgia excluding ATL/RG). Median age and incidence counts include cases diagnosed in 2006-2010. Relative survival rates include cases diagnosed in 2003-2009.

# Management of Acute Myeloid Leukemia

Cherry, E et al. *Blood Advances* 5(24):5565-5573, 2021

# Role of STAT3 in AML

- STAT3 = transcription factor
- Known to regulate glutamine uptake via MYC-SLC1A5
- Regulates Oxidative Phosphorylation
- Also known to transport to the mitochondria directly, signaled by pSTAT3 S727

Amaya M.L., et al, *Blood* 2022; 139 (4): 584–596.

# Current Work

## AIMs

- Determine how mitochondrial STAT3 modulates mitochondrial metabolism in AML
- Determine STAT3's interaction with mitochondrial proteins
- Determine the therapeutic potential of targeting STAT3 in AML

# Results

## *STAT3 expression and inhibition*

STAT3 is prominently expressed in AML patient samples and Molm13 cells.

Phosphorylated STAT3 (pSTAT3) translocates to the mitochondria

STAT3 inhibition decreases pSTAT3 in the whole cell (left) and in the mitochondria (right)

# Results

*Mitochondrial STAT3 interacts with Voltage Dependent Anion Channel-1 (VDAC1)*

Co-IP Assay

# Results

*Mitochondrial STAT3 interacts with Voltage Dependent Anion Channel-1 (VDAC1)*

STAT3 Binding Proteins

HSC Colony Forming Assays

# Results

*STAT3 and VDAC1 inhibition decrease viability and impair engraftment potential*

Ex vivo PDX mouse models

Inhibition of STAT3

Inhibition of VDAC1

HSC Colony Forming Assays

# Conclusions

- STAT3 is prominently expression in AML and phosphorylation triggers mitochondrial localization
- STAT3 interacts with VDAC1 in the mitochondria, a novel protein-protein interaction
- Inhibition of STAT3 and VDAC1 results in:
  - Impaired OXPHOS
  - Decreased mitochondrial calcium
  - Decreased Mito Membrane Potential
  - Decreased AML cell viability
  - Impairs AML engraftment potential
  - Altered ROS

## The STAT3-VDAC1 axis modulates mitochondrial function and plays a critical role in the survival of acute myeloid leukemia cells

*by Kellen B. Gil, Jamie Borg, Rosana Moreira Pereira, Anagha Inguva-Sheth, Geovana Araujo, Jeremy Rahkola, William Showers, Abby Grier, Angelo D'Alessandro, Clayton Smith, Christine McMahon, Daniel A. Pollyea, Austin E. Gillen and Maria L. Amaya*

*Received: January 10, 2025.*

# ***An *In Vitro* Model of Fetal Growth Restriction Inhibits Angiogenesis via Extracellular Vesicle Release of microRNA 141-3p***

**Caitlin (Cait) Eason, MD, MPH**

**Derderian Lab**

University of Colorado School of Medicine

December 11, 2025

# Background: Fetal Growth Restriction

---

- Fetal weight below the 10<sup>th</sup> percentile
- Affects 3-10% of pregnancies and accounts for nearly 50% of stillbirths
- High rate of perinatal morbidity/mortality
- Associated with cognitive and developmental delays
- Annual US healthcare cost > \$15 billion

# Background

- Placental pathology demonstrates reduced feto-placental angiogenesis in FGR
- microRNAs (miRNAs) within the fetal growth restricted placenta have altered levels of expression

# Background

- microRNA

# Background

## Intracellular Effects

## Extracellular Vesicles

# Background

# Hypothesis

---

We hypothesize that nutrient restriction in trophoblasts (hTSCs) simulate the release of EV-miRNAs that communicate with placental endothelial cells to suppress angiogenesis

# Methods

# Methods

# Results

---

In 8 “Simple” Steps...

# Step 1: Confirm Nutrient Restriction Model

A

MTT Assay

B

Apoptosis

# Step 2: Characterization of Extracellular Vesicles

# Step 3: mRNA seq of HUVECs + EVs

## mRNA Expression of HUVECs Exposed to hTSC EVs

# Step 3: mRNA seq of HUVECs + EVs

Downregulated Pathways Targeted by HUVECs Exposed to Nutrient-Restricted vs Nutrient Complete hTSC EVs

# Step 4: miRNA seq of EVs

# Step 5: mRNA seq of HUVECs + miR-141-3p

mRNA Expression of HUVECs Exposed to miR-141-3p

# Step 5: mRNA seq of HUVECs + miR-141-3p

Downregulated Pathways Targeted by HUVECs  
Exposed to miRNA 141-3p

# Step 6: Mechanistic Study- Tube Formation Assay

  
miRNA-141-3p

Mechanistic & Targeted  
Gene Studies

- Tube Formation Assay
- Dual Luciferase Assay

**Controls**

**+ miR 141-3p**

**+ miR 141-3p  
Ant**

# Step 6: Mechanistic Study- Tube Formation Assay

miRNA-141-3p

Mechanistic & Targeted  
Gene Studies

- Tube Formation Assay
- Dual Luciferase Assay

# Step 7: Targeted Gene Study- Dual Luciferase Assay

## Mechanistic & Targeted Gene Studies

- Tube Formation Assay
- Dual Luciferase Assay

**Wild Type YAP-1 UTR (x2 miR-141-3p Binding Sites)**

WT YAP-1 UTR

**NO2: 2nd Binding site Mutated on YAP-1 UTR**

NO2 YAP-1 UTR

**NO1: 1 Binding site Mutated on YAP-1 UTR**

NO1 YAP-1 UTR

**NO-NO: BOTH Binding site Mutated on YAP-1 UTR**

NO-NO YAP-1 UTR

## Anticipated Results IF miR-141-3p Targets YAP-1

- **WT YAP-1 UTR:** reduced luc activity when +miR 141-3p, return to baseline with +miR 141-3p Ant
- **NO1:** +miR 141 slightly reduced luc activity but less than WT
- **NO2:** +miR 141 slightly reduced luc activity but less than WT
- **NO-NO:** +miR 141 remains the same at WT without miR added, no change with +miR 141 Ant

# Step 7: Targeted Gene Study- Dual Luciferase Assay

Effects of miR-141-3p on Luciferase Activity of YAP-1 UTR

Mechanistic & Targeted  
Gene Studies

- Tube Formation Assay
- Dual Luciferase Assay

# Step 8: Targeted Gene Study- YAP-1 ELISA & Western

miRNA-141-3p

Mechanistic & Targeted  
Gene Studies

- Tube Formation Assay
- Dual Luciferase Assay

YAP-1 Protein Concentration

# Conclusions

---

- Nutrient-restriction in hTSCs stimulates the release of EVs with upregulated miR-141-3p
- Endothelial cell exposure to nutrient-restricted hTSC EVs and miR-141-3p
  - Downregulate pathways essential to angiogenesis
  - Reductions in *YAP-1* gene expression, a potential mechanism
- miR-141-3p decreases *in vitro* tube formation of endothelial cells
- Endothelial cell exposure to miR-141-3p demonstrates diminished YAP-1 protein expression
  - Additional studies needed to confirm specific targeting

# Future Directions

---

- Mouse blastocyst with upregulated miR-141-3p
- Nutrient restriction in early placental organoids

***Concurrent changes in macrophage and T cell subsets over time in murine obstructive cholestasis suggest interplay between macrophage and T cell function in promotion of hepatic injury***

Lauren (Lo) Maloney, MD  
Mentor: Dr. Sarah Taylor

# Background: Biliary Atresia (BA)

1/7000 live  
births – 1/15,000

**Transplant**

Leading indication in  
children worldwide

*Liver biopsy from an infant with BA at diagnosis that underwent liver transplant before 2 years of age. Histologic findings include expansion of the portal tract with stromal edema, prominent fibrosis, bile duct proliferation (black arrows), and bile plugs (white arrows).*

# Background: immunology

- Unique tolerogenic microenvironment of the liver → impaired in disease.
- Oligoclonal expansion of T & B cells in cholestatic injury = supports presence of antigen-driven immune stimulation to autoantigens.
- **Impaired function of Tregs & Th1 dominant immune response** in most infants early in disease have been shown in BA.
- Recent work from Taylor lab → **macrophage heterogeneity in neonatal murine models of obstructive cholestasis; reduction in immune regulatory function of hepatic macrophages** in cholestatic models compared to non-diseased mice.

# Background: BA model

# CD8 T cells

# CD4 T cells

# T cell ratios

# Macrophages

# scRNA-seq

# scRNA- seq: macrophages by cluster

Adult healthy: macrophage clusters

Adult BDL: macrophage clusters

# Conclusions and Future Directions

- In a murine BDL model of obstructive cholestasis, at POD 3 the cholestatic group has significantly more CD8 and CD4 T cells, although fewer FoxP3 T regulatory CD4 t cells than baseline or sham surgical condition.
- At POD 7 the sham surgical group demonstrates shift in T cell compartment closer to baseline, while the cholestatic group shows persistent decrease in CD4/CD8 ratio compared to baseline.
- At POD 3 animals who underwent BDL have significantly tissue resident macrophages and those of inflammatory phenotype than sham or baseline groups. At POD 7, cholestatic mice demonstrate persistent inflammatory macrophage phenotype and increased number of MHC2 positive macrophages, indicating an increase in antigen presentation capacities.

# Background

- Biliary atresia (BA) is the most common indication for pediatric liver transplantation (LT)
- Restoration of bile flow with Kasai portoenterostomy is crucial
- Characterized by cholestatic liver injury with cellular apoptosis and immune cell recruitment (i.e., macrophages [MΦs])

# Cellular Senescence

- State of cell cycle arrest but active
- Natural response to DNA damage to prevent proliferation of abnormal cells
- Favorable role in tissue repair and regeneration or promote tissue injury
- Effect of senescent cells on tissue injury is influenced by senescent cell-cell interactions

# Cellular Senescence in Biliary Atresia

- Increased numbers of senescent cells in murine BA
- Increased cellular senescence at diagnosis is associated with improved outcome in children with BA as defined by longer duration of survival with the native liver

# Central Hypothesis

- MΦ efferocytosis of senescent cells promotes tissue regeneration in neonatal obstructive cholestasis whereas senescent cells impair efferocytosis and exacerbate tissue injury in older patients

## Specific Aim/Research Question

- How does senescent cell depletion impact severity of liver injury in neonatal versus adult mice after bile duct ligation (BDL)?

# Experimental Design

- Murine Model of BDL in C57BL/6 (B6) mice
  - Responsible Conduct of Research - IACUC approval
- BDL replicates clinical features of cholestasis
- Outcome analyses:
  - Neonate (BDL on day of life 10 [DOL10]): postoperative day 7 (POD7) or DOL17
  - Adult (BDL on week 8-12): POD7

Neonatal Bile Duct Ligation Performed on DOL10 by Dr. Ioannis Ziogas

Figure. A. Identification of bile duct in neonatal mouse weighing 8 g. B-C. Ligation of murine bile duct with two 8-0 Nylon sutures

- Dasatinib (5 mg/kg)
- Quercetin (50 mg/kg)

# Outcome Measures

- Biochemical markers of cholestatic liver injury
- Histologic liver injury (Ishak score)
- qPCR analysis for expression of markers of senescence
- Flow cytometry for senescent cells (e.g., cholangiocytes)

# Preliminary Results

- Still perfecting neonatal BDL model given maternal cannibalism of pups, so started proof of concept experiments with adult mice for the efficacy of D+Q injections and determination of optimal dosing

Adult (8-12-week-old) C57BL/6 mice

A)

B)

C)

A) BDL POD1 inj POD2 sac

# Blood Chemistry

t-test with Welch's correction in 12 mice

Excluding 1 with abnormal ascites and 2 females

# qPCR Analysis

t-test with Welch's correction in 12 mice

Excluding 1 with abnormal ascites and 2 females

B) BDL POD1+2 inj POD3 sac

# Blood Chemistry

t-test with Welch's correction in 21 mice

# Ishak Score

t-test with Welch's correction in 12 mice

# qPCR Analysis

t-test with Welch's correction in 16 mice

C) BDL POD4-6 inj POD7 sac

# Blood Chemistry

t-test with Welch's correction in 15 mice

# Ishak Score

t-test with Welch's correction in 16 mice

# qPCR Analysis

t-test with Welch's correction in 16 mice

# Flow Cytometry

t-test with Welch's correction in 8 mice

# Conclusions & Future Directions

- Combination of dasatinib & quercetin can lead to depletion of senescent cells, yet the dosing and impact on disease progression warrants further investigation
- Next steps will include:
  - qPCR analysis of additional fibrosis and senescence-associated secretory phenotype factors
  - Beta-gal, CK19, Ki-67, sirius red staining
  - Neonatal BDL
  - Evaluation of fisetin (flavonoid senolytic agent)

**Microglial phagocytic response to EV-D68 infection  
in the spinal cord during early postnatal  
development**

# Enterovirus D68 and Age Specific Vulnerability to Acute Flaccid Myelitis

- Enterovirus D68 (EV-D68) is a respiratory pathogen that has emerged as a cause of acute flaccid myelitis (AFM) in children in the past decade
- Over 90% of EV-D68 associated AFM cases occur in patients who are younger than 18 years old, with a median age of 7.1 years in the 2014 outbreak (Sejvar et al., 2016) and 5.3 years during the 2018 outbreak (Kidd et al., 2021).

## EV-D68 RNA in the Anterior Horn Neurons of the Spinal Cord of 5 year old boy who died of an AFM-like illness in 2008

Enterovirus D68 (EV-D68)—specific genomic RNA is demonstrated by in situ hybridization

Vogt et al., N Engl J Med. 2022 386(21):2059-2060.

# Mouse Model of EV-D68 and Acute Flaccid Myelitis

Hixon et al., PLOS Pathogen. 2017; 13(2)

Motor neuron is larger in size than surrounding interneurons

Gallocyanin

# Microglia: Brain Resident Immune Cells

**Do microglia help mediate age-dependent susceptibility to development of acute flaccid myelitis?**

Microglia are immune cells responsible for responding to disruptions in homeostasis, including:

- Infection
- Injury

- Microglia are involved in developmental events such as neurogenesis and myelinogenesis and may respond differently to environmental cues during these periods
- Viral infection during critical periods may thus result in a dysregulated microglia response

# Microglia in the CNS exhibit phagocytic predominance in the first postnatal week

Single cell microglia analysis identified a microglia subset that showed a distinct gene expression profile in the first postnatal week associated with areas of proliferation

- CD11c+ microglia (Wlodarczyk et al., 2017)
- Axon tract associated microglia (Hammond et al., 2019)
- Proliferative region-associated microglia (Li et al., 2019)
- Youth-associated microglia (YAM) (Silvin et al., 2022)
- Aringase-1+ microglia (Stratoulis et al., 2023)

Proportion of CD11c+ microglia highest at postnatal day 4 in the spinal cord

## Common Markers

# Objective

**Do microglia help mediate age-dependent susceptibility to development of acute flaccid myelitis?**

*Objective:* Perform time course to assess for peak microglial response and phagocytic activity following EV-D68 infection.

*Experiment:* Infect Swiss–Webster mouse pups with EV-D68 at postnatal day 1 (when paralysis is expected) and PBS in the left hindlimb. Obtain samples at 2, 4, 6 and 8 days post-infection to determine time point for peak microglia response.

## Immunohistochemistry Markers

Microglia & Phagocytosis	Neuron
Iba1	NeuN
Cd68	ChAT

Postnatal Day 1

## Days Post Infection

# IM injection of EV-D68 at postnatal day 1 induces paralysis

# EV-D68 infection associated with increase in microglia CD68

6 Days Post-Injection  
CD68 / Iba1 / DAPI

Ipsilateral CD68 Mean Gray Value / Iba1+ Object

# Key Takeaways

- EV-D68 infection in first postnatal week induces paralysis in mouse model of acute flaccid myelitis
- EV-D68 infection is associated with spinal cord ventral horn motor neuron loss
- EV-D68 infection promotes microglia accumulation and increased microglial phagocytic activity

CD68 / Iba1 / DAPI

8 Days Post-Infection

# Up Next: Contrast microglia response to EV-D68 infection in the spinal cord during early and late postnatal development

Postnatal Day 1

DPI 6

Postnatal Day 15

DPI 6

Treatment	Paralysis	Virus in Spinal Cord	Accession #	Source
PBS	No	No		
IL/14-18952	Yes	Yes	KM851230	2014, USA, Respiratory
2022-23447	No	Prelim data-yes	OR235127	2022, USA, Respiratory

## Immunohistochemistry & Mass Cytometry:

Microglia Subtype	Phagocytosis	Neuron
Cd11c (Itgax)	Clec7a	NeuN
IFITM3	Cd68	ChAT
Clec7a	MERTK	CC3

## Paralysis Scores 6 Days Post Infection

# Future Questions:

- Does microglia depletion prior to infection with EV-D68 at postnatal day 1 mitigate the development of paralysis?
- Does disrupting microglia phagocytosis “rescue” otherwise viable motor neurons or prevent microglial antigen presentation to T cells and the resulting inflammatory response following EV-D68 infection?

# Exploring Mitochondrial Transplantation as a Novel Therapy for Embolic Stroke

StARR Scholar: Brian Wu, MD

General Surgery Resident PGY-4

Mentors: Dr. Buttrick and Dr. Reece

# Outline

- Introduction
- Aim and Hypothesis
- Study Design
- Model Preparation
  - Arm 1: Intranasal mitochondrial delivery
  - Arm 2: Embolic stroke model
- Current Progress

# Introduction

- Cardiac and aortic surgery have higher incidence of perioperative stroke compared to non-cardiac surgery
- The incidence of stroke in extensive aortic arch replacement for acute Type A dissection can be up to 20%

Embolic stroke with hemorrhagic conversion

# Preventive Strategies Against Stroke

**Delay elective cardiac surgery in those with recent stroke**

**Minimize aortic manipulation and optimize cerebral perfusion**

**Implement atrial fibrillation prophylaxis and treatment**

# Challenges in Management of Perioperative Stroke

## Limited treatment options

- Thrombolysis and thrombectomy are often not feasible in post-cardiotomy patients due to risk of bleeding and need for crossing fresh anastomoses

## Ischemia-reperfusion (IR) injury

- Restoration of cerebral blood flow can trigger a secondary IR injury
- The sudden oxygen influx and oxidative stress can lead to mitochondrial dysfunction, DNA damage, inflammatory response, and activation of apoptosis

# Challenges in Management of Perioperative Stroke

- Mitochondrial transplantation (MTx) has shown promising results in mitigating neuronal injuries in traumatic and ischemic models

Spees, JL, et al. *Proc Natl Acad Sci USA*, 2006.

McCully, JD, et al., *Am J Physiol Heart Circ Physiol*, 2009.

Zhang, B, et al. *World Neurosurg*, 2020.

Nakamura, Y, et al. *Stroke*, 2020.

# Can we prevent permanent cerebral injury?

- Mitochondrial transplantation (MTx) has shown promising results in mitigating neuronal injuries in traumatic and ischemic models

## Our first cell model

**Excessive ROS?**

## Our refined cell model

# MTx Improved Cell Viability and Proliferation

- Ischemic (OGD) subgroup: Untreated vs. Mito

# Nicorandil Further Enhanced the Effects

- Ischemic (OGD) subgroup: Untreated vs. Higher dose of Mito  $\pm$  NIC

Cell Viability (MTS)

Cell Proliferation (CyQUANT)

# MTx Improved ATP Production

- Ischemic (OGD) subgroup: Untreated vs. Mito

# Nicorandil Further Augmented ATP Production

- Ischemic (OGD) subgroup: Untreated vs. Higher dose of Mito  $\pm$  NIC

# Aims: From *In Vitro* to *In Vivo*

- We evaluated whether mitochondrial pre-treatment prior to ischemia reduces stroke severity and irreversible cerebral injury *in vivo*
  - **Aim 1:** Demonstrate the neuroprotective effect of pre-ischemia mitochondrial transplantation
  - **Aim 2:** Optimize dosing and timing for mitochondrial transplantation

# Hypothesis

- Mitochondrial transplantation prior to ischemic stroke will reduce the severity of neurological deficits and preserve neurons

# Study Design

1. Rodent stroke model (embolic)
2. Non-invasive intranasal delivery of exogenous mitochondria
3. Comparison of the neurobehavioral outcomes, brain imaging, and histological outcomes among **Sham, Stroke without Mito Pre-treatment, Stroke with Mito Pre-treatment**, and Sham with Mito-Pretreatment

# Refinement of In Vivo Stroke Models

- Started with murine embolic stroke model
  - ➔ Murine microfilament middle cerebral artery occlusion model
  - ➔ Murine bilateral carotid artery occlusion model
  - ➔ **Rat embolic stroke model using microbeads**

# Rat with Embolic MCA Stroke

# Preparation for Mitochondrial Transplantation

Quadriceps Muscle Harvest  
from Adult SD Rat

Tissue Homogenization and  
Serial Centrifugation

Mitochondrial Staining

# Intranasal Mitochondrial Delivery

- *In vitro*, we labeled donor mitochondria with **MitoTracker Red** to visualize uptake by recipient cells
- *In vivo*, we found unreliable results with the MitoTracker or other membrane labeling, likely due to dye leakage
  - **BrdU**-labeled mitochondria were subsequently used to track migration from the nasal cavity to the brain

Ctrl Rat: No Mito given

Rat#1: total 200  $\mu$ g Mito  
Anterior/Middle

Rat#1: total 200  $\mu$ g Mito  
Posterior

Rat#2: total 200  $\mu$ g Mito  
Anterior/Middle

Rat#3: total 720  $\mu$ g Mito  
Anterior/Middle

# Brain MRI Imaging Protocol

- AISR Protocol
  - High-resolution T2-turboRARE MRI (sagittal, axial and coronal planes)
  - DWI with 6 b-values (axial plane)
  - SWI (axial plane)
  - Bruker 9.4 Tesla BioSpec Rat Head Array Coil
- Timeline: Baseline, Post-Stroke Day 1, and possible more
- **Currently we have obtained baseline brain images from 5 rats for reference. Additionally, we have performed brain MRI on five stroke rats on day 1**

# First Mitochondria Pre-treatment Model

- Group
  - Sham x3 (One died d/t anesthesia)
  - Mito x 2
  - Stroke x4 (One died during recovery from anesthesia on POD0)
- Mitochondria labeled using BrdU
- Sham received intranasal hyaluronidase (50  $\mu$ L x 2) + saline (50  $\mu$ L x 2)
- Mito received intranasal hyaluronidase (50  $\mu$ L x 2) + mitochondria (50  $\mu$ L x 2 / 16  $\mu$ g/ $\mu$ L  $\rightarrow$  1600  $\mu$ g)
- Stroke received intranasal hyaluronidase (50  $\mu$ L x 2) + saline (50  $\mu$ L x 2)

# Blinded Behavioral Assessment

**Balance beam test**  
**One component of mNSS**

# Open Field 11/17/25 (POD4)

# Current Mitochondrial Pre-treatment Model

- Three independent experiments since mid November 2025
  1. 11/18
    - Mito x 2
    - Stroke x2 (One found dead on post-stroke day 1)
  2. 12/03
    - Stroke x 3 (One euthanized on post-stroke day 2 due to respiratory concern)
    - Mito x 2
  3. 12/08
    - Sham x 3
    - Stroke x 3
    - Mito x 3
- Mito received intranasal hyaluronidase (25  $\mu$ L x 2) + mitochondria (25  $\mu$ L x 2 / 16  $\mu$ g/ $\mu$ L -> 800  $\mu$ g)
- Stroke received intranasal hyaluronidase (25  $\mu$ L x 2) + saline (25  $\mu$ L x 2)
- Sham received intranasal hyaluronidase (25  $\mu$ L x 2) + saline (25  $\mu$ L x 2)

# Blinded Behavioral Assessment

# Blinded Behavioral Assessment

## Sample size

- Stroke n = 5 - 1
- Mito n = 4

## Survival status

- One untreated rat died on POD1 and one euthanized on POD2
- All treated rats were alive by POD3

# Brain MRI Outcome

- Baseline results from two normal rats
- Post-stroke images obtained from 5 stroke rats without treatment

**Rat #1 (09/16/25, 289 g)**

**T2\_TurboRARE\_sagittal**

This is a high-resolution fast-spin echo T2-weighted protocol for structural/ volumetric assessment of brain compartments/ tissue injury/ edema.

**T2 RARE sequence**

TR/ TE = 2,511/ 33 ms

Slice thickness: 1.2 mm

Slice gap: 0.3 mm

Number of slices: 24 (sag)/

22 (ax)/ 10 (cor)

FOV: 35x35 mm

Matrix size: 256x256

Number of repetitions: 4

**Rat #1 (09/16/25, 289 g)**  
**T2\_TurboRARE\_Axial**

**Rat #1 (09/16/25, 289 g)**  
**T2\_TurboRARE\_Coronal**

# Rat #1 (09/16/25, 289 g)

DWI\_Axial

This is a physiological echo-planar diffusion weighted protocol to determine apparent diffusion coefficients (ADC) reflective for brain cytotoxic edema and tissue regeneration.

DTIEPI sequence  
TR/ TE = 3200/ 33 ms  
Slice thickness: 2.0 mm  
Slice gap: 0.5 mm  
Number of slices: 7 (ax)  
FOV: 25x25 mm  
Matrix size: 96x96  
Number of repetitions: 2  
6 b-values (0, 200, 500, 800, 1000, 1200)

**Rat #1 (09/16/25, 289 g)**

**SWI\_Axial**

This is a physiological susceptibility weighted protocol to detect hemorrhage, microbleeds and iron accumulation in the brain

- SWI FLASH sequence
- TR/ TE = 350/ 26 ms
- Slice thickness: 0.5 mm
- Slice gap: 0.1 mm
- Number of slices: 9 (ax)
- FOV: 25x25 mm
- Matrix size: 96x96
- Number of repetitions: 6

Rat #2 (09/16/25, 300 g)  
T2\_Turbo\_SAG

**Rat #1 (09/16/25, 300 g)**  
**T2\_Turbo\_AX**

**Rat #1 (09/16/25, 300 g)**  
**T2\_Turbo\_COR**

Rat #1 (09/16/25, 300 g)  
DWI\_AX

Rat #1 (09/16/25, 300 g)  
SWI\_AX

# Future Plan

- December 2025 – February 2026: Establish sufficient samples in each group for neurobehavioral assessment (main cohort)
- March – April 2026: Complete tissue analysis – neuron counting, quantify ischemia area, other special staining. Collect additional tissue samples as needed
- April – May 2026: Complete the image cohort (secondary)
- May – June 2026: Finalize statistical analysis and generate results for an abstract and/or manuscript

Thank You
